A. Own (diagonal) effect of each sign bit on its own response surface

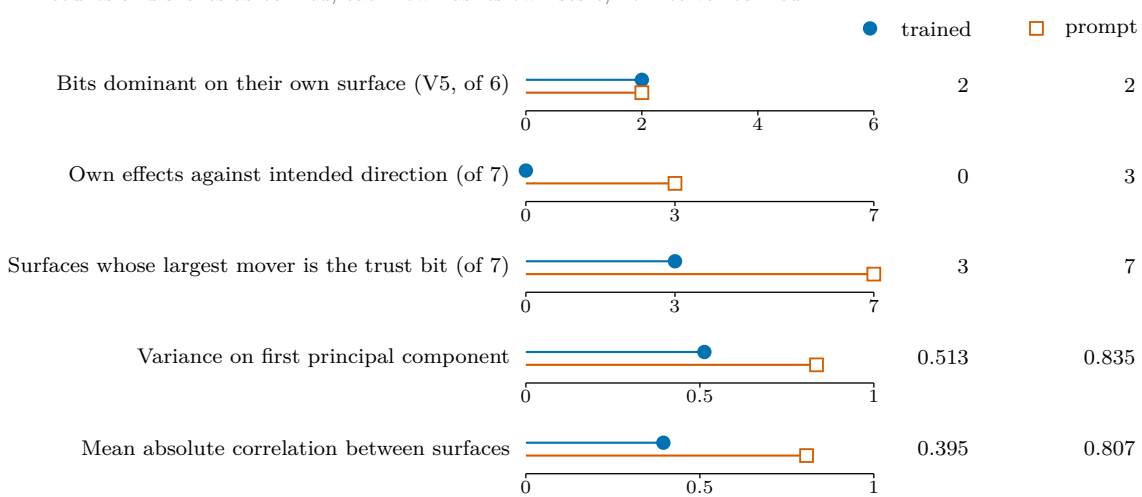

only the 7 own effects are banked, not the full 7×6 cross-effect matrix; no uncertainty interval is banked

raw composite units; each row has its own scale, so compare trained with prompt within a row, not across rows

B. Entanglement summary

counts and shares as banked; each row has its own scale; no interval banked

Trained: second-bank adapters; prompt: sign-profile prompt on the base model; 64 sign profiles, strict battery, model side only. Descriptive. Bit-surface effects are changes in model response distributions, not statements about internal mechanism.
